	•	PRODUCTION OF LIQUI	O OXYGEN IN THE USSR				
25X1		·		\neg			
25X1 25X1	It is stated that in 1938 the USSR occupied the first place in Europe as a producer of oxygen and that the rate of development of this industry was such that this country was rapidly moving up to the first place in the world (see "Oxygen in Metallurgy," "Equipment for Liquid Oxygen Froduction Used in the USSR," Which is based on a book by S. Ya. Gersh (1), lists the types and capacities of the latest equipment for the production of liquid oxygen used in the USSR as of 1949. Capacities corresponding to an output of 30, 130, 250, 300, 1,000, and 3,500 cubic meters of oxygen and 1,000 kg of liquid oxygen per hour per individual machine are mentioned. This equipment is distributed by Glavkislored (Main Oxygen Administration). Work on the development of some of the latest types of equipment was done by VNIIKIMASh (All-Union Scientific Research Institute of Oxygen Machine Building).						
	been ins expensive that it to be si is regar ried out neverthe of 12.75 rail and ported be The firs 1946. They have longate for lique following that the total that the total total that the total that t	is not known at what plants to talled, but Gersh's statement to and that it should not be to should be produced near the profit of the transition of the most desirable profit of the transition of liquid oxygen are used not of liquid oxygen are used for storage yrail, there tanks are fasted the experimental shipment of oxinks of this type are now telled elylindrically shaped inner the cylindrically shaped inner do oxygen with a spherical in graph capacities in kilograms of and 13,600. In addition to the	that transportation ransported over too place where it is use (1) While local procitice and for that reportation of this proceed for the transport at stationary instanted by means of chair ygen in a railroad transport at stationary refiller surface with round elements of the resultance of the result	of liquid oxygen is great a distance (i.e., d or consumed) seems duction of liquid oxygen eason is probably caroduct over long distances, tanks having a capacity atlon of this product by llations. When transms to ordinary flat cars. ank was carried out in d at large oxygen plants. Inde 'and therefore appear sterns." Stationary tanks. These tanks have the 5, 2,250, 3,380, 4,500.

smaller tanks for transportation by motor truck. These tanks have the following capacities in kilograms of oxygen: 733, 1,465, 2,965, and 3,380. Oxygen is also supplied in ordinary small cylinders, which according to USSR practice are painted light blue when they contain oxygen (there is a standard color for each kind of gas). Users who require gaseous oxygen obtain it by evaporating liquid oxygen by means of so-called gasifiers into which the liquid is transferred from stationary or movable tanks. There are heated gasifiers for small quantities and cold gasifiers for developing large quantities of oxyger gas. The cold gasifiers can also be used for storing liquid oxygen and have the following capacities in kilograms be used for storing liquid oxygen and have the following capacities in kilograms of liquid oxygen: 136, 271, 556, 1,080, and 2,195. Hot gasifiers mounted on motor trucks are available for small users who do not have their own equipment for evaporating the oxygen.(2)

The following industrial applications involving the use of oxygen have been initiated, investigated, or developed wholly or in part and introduced into industrial practice in the USSR: use in blast furnaces and open hearth furnaces utilization in such branches of industry as production of nitric acid, sulphuric acid, calcined soda, and calcium carbide (3); and gasification of solid fuels _______ The use of oxygen permits raising the efficiency of ordinary sulphuric acid contact plant equipment by a factor of 5-6.(4) 25X1 25X1 25X1
